

Discharge Summary

Name	Guy Brown
Birth Date	08/01/1967
Gender	male
Post Code	962

Admission Date	01/01/2020
Discharge Date	01/03/2020

Medications

TRIAMTERENE AND HYDROCHLOROTHIAZIDE
MEPRO-ASPIRIN
MEMANTINE HYDROCHLORIDE
EPOGEN/PROCRIT

The patient was diagnosed with Endocarditis, valve unspecified and showed symptoms of hypotension and hypertension, which resulted in a loss of appetite, as well as a large number of abdominal muscles. The patient had a period of weakness of 6 to 9 hours and did not lose appetite, and the patient's blood pressure was lowered rapidly. It is not known whether he lost this condition, but he may have a more normal appetite in this condition. This is a very unusual patient and, in any case,

The patient was given LOSARTAN POTASSIUM AND HYDROCHLOROTHIAZIDE.

LOSARTAN POTASSIUM

What is it?

LOSARTAN POTASSIUM is an electrolyte composed of a form of amino acid called lysine which contains an amino acid, threonine which is an amino acid and choline which is an amino acid as a base. It's important that

The patient was moved to another clinic in October 2015 for a new kidney transplant. On his return to the clinic, he was found to have kidney cancer and died after six days of waiting.

The new clinic was scheduled to be opened in October 2017.

The patient was given ISORDIL (i.e., AFROCAM) and his body was transported to the Hospital of the University of Pretoria, in South Africa, for further evaluation. After completion of the evaluation, the patient underwent a new biopsy of the kidney, renal, and liver (3-6 days post-intervention).

There were no differences in blood-pressure readings between patients receiving IV and IVI, or between patients receiving either medication.
